Heuristic Evaluation Sheet for Mobile Designs

On the next page, you'll find a table of heuristics created by Bertini et al. to evaluate your mobile designs. This list of heuristics specially cover areas pertinent to mobile usage—for instance, ergonomics, glanceability, and privacy conventions. Hence, this sheet is **ideal for use on your mobile design projects**.

Additional notes on how to use the heuristics evaluation table are provided after the table. Feel free to print this evaluation sheet out and start putting your very own ideas to the test!

Severity scale

Severity is reported on a scale of 0-4:

- **0** = I don't agree that this is a usability problem at all
- **1** = Cosmetic problem only: need not be fixed unless extra time is available on project
- **2** = Minor usability problem: fixing this should be given low priority
- **3** = Major usability problem: important to fix, so should be given high priority
- **4** = Usability catastrophe: imperative to fix this before product can be released

Explanation of heuristics

1. Visibility of system status and loseability / findability of the mobile device

- Always keep users informed about what is going on.
- Prioritize messages regarding critical and contextual information (e.g. battery & network status).
- Ensure data is encrypted, backed-up elsewhere to minimize loss.
- The system or application should make it easy to find the device, if misplaced.

2. Match between system and the real world

- Speak the users' language, with words, phrases and concepts familiar to the user, rather than system-oriented terms.
- Follow real-world conventions, making information appear in a natural and logical order.
- Sense the environment and adapt the presentation of information accordingly.

3. Consistency and mapping

- Users' conceptual model of the function/interaction should be consistent with the context.
- Consistent mapping between actions and interactions with device controls (e.g. buttons) and corresponding real tasks (e.g. navigation in the real world).

4. Good ergonomics and minimalist design

- Devices should be comfortable to hold and carry, and robust to damage.
- Screen real estate should be used parsimoniously.

5. Ease of input, screen readability and glanceability

- Provide easy ways to input data, reducing the need to use both hands
- Screen content should be easy to read and navigate under different conditions (e.g. lighting).
- User should be able to get the crucial information from the system by glancing.

6. Flexibility, efficiency of use and personalization

- Allow user to tailor and personalize frequent actions.
- Allow user to dynamically configure the system according to contextual needs.
- The system should support and suggest customization if it would be crucial or beneficial.

7. Aesthetic, privacy and social conventions

- Aesthetic and emotional aspects of the mobile device and system use must be taken into account.
- User data must be kept private and safe.
- Mobile interaction should be comfortable and respectful of social conventions.

8. Realistic error management

- Shield mobile users from errors.
- When errors occur, help users to recognize, diagnose and recover from the error.
- Error messages should be plain and precise.
- Constructively suggest solutions—if none are available (or impact is negligible), allow the user to gracefully cope with the error.
